

Interview script

Intro question

1. Could you first briefly give an overview of the company or organization that you work for? What are the main products or services, and what are the main processes or systems that go into providing those products or services?

Role-specific questions

2. Now let's focus on one role that you have experience in or oversee. Please tell me the role and describe its purpose and what it provides for the company or organisation.
3. What are the main duties or responsibilities that are involved in the role? List three or four duties that are fundamental to that role (*note these down for later*).
4. Could you describe a typical day in the role? Please list the tasks, even small tasks, that an employee would regularly perform as part of this role.
5. What tools, software or equipment are frequently used in this role?

Person-specification questions

6. Imagine you are hiring a new candidate for the role, what are the main qualities that you would look for? What types of technical skills, qualifications or prior training would you look for? Are there any soft skills that are particularly important?
7. After hiring a new employee in this role, what kind of specialist training would they need to perform the job well. What are the skills or abilities that the candidate would need to develop over time to be successful in the role?
8. What would you say are the hardest aspects of the role? What important tasks of the role would you say are relatively easy for new employees to perform?

Ability questions

9. We are interested in the very basic abilities that are important for this role. What every-day, common-sense human abilities do you think are important to perform the role well that most new employees would already have?
10. We have made a list of very basic cognitive abilities (*share list*). These are the sorts of common abilities that infants or animals often possess, but are not necessarily

present in robots or AI systems. We will go through each of these basic abilities one by one and ask you about how each of them relates to the duties you mentioned earlier (*Read out the 3 or 4 duties mentioned earlier*)

- a. (*Read out the ability and the description. Check understanding before continuing.*) How important do you think this ability is for the role? How would you rate its importance from 1 (not very important) to 5 (extremely important)?
- b. Imagine an experienced colleague in the job role has had a terrible accident leading to selective brain damage, and they have completely lost this ability, but are otherwise unchanged.

Now thinking about the duties – which of the duties would the colleague most struggle with after the accident? How much more difficult would they find that duty from 1 (a little more difficult) to 5 (almost impossible)?

AI questions

11. How has AI impacted this role in your business so far, and in what ways?
12. Given all we have discussed, what do you think will be the future impact of AI on this role?
